
How Decibullz Work

HEAT

The Decibullz Earpieces are made of a unique thermoplastic that softens in hot water. Once soft the earpieces lose temperature rapidly while remaining moldable. This allows them to be safely placed into the ear and shaped with your finger. Shaping the earpieces is easy and they can even be re-molded if necessary.

SHAPE

Once heated and allowed to cool for 30 seconds the Decibullz earpieces are ready for shaping. Just insert the mold into your ear and use your finger to shape the earpiece. The mold will be warm and pliable, it feels really nice.

Note: Do not place the earpieces into your ear if it is hot. Wait until it is warm and soft.
